

FailUnless Should Not Be Used In Python Unit Tests To Test Identity

In unit test, use `assertEqual`, so we see the difference in traceback

Good Example:

```
self.assertEqual(self.getSimulationState(), "draft")
self.assertNotEqual(self.getSimulationState(), "delivered")
```

Bad Example:

```
self.failUnless(self.getSimulationState() == "draft")
self.failUnless(self.getSimulationState() != "delivered")
```
